Details of tests proposed to be undertaken by the center.

1. Pharmaceutical Testing

- i. **Franz diffusion:** For In vitro skin permeation studies of topical formulations

Franz Diffusion Apparatus is used for studying blood release products like transdermal products, semi solids, emulsions and suspensions and it can also be used for nano formulations.

- ii. **Elemental Analysis CHNS(O)**

In Pharmaceutical manufacturing CHNS (O) Elemental Analysis is used for characterization of API and intermediate. It determines the amount of carbon, hydrogen, nitrogen, sulfur, and oxygen in a sample. It is a reliable and cost-effective test method which can be used to assure the behavior of pharmaceutical drugs, quality of biofuels, nitrogen in soil and compost CHNS (O) analysis can be used to confirm the purity of products at every stage to maintain and control the production, document, and the product quality. Understanding the composition of the organic elements helps the analysts to determine the structure of the sample substance. It allows a fast, accurate assessment of elemental composition to be made with minimal sample preparation. This enables it to be used as a quick screening test to check that a pure chemical is within a defined specification either prior to use or during manufacturing. If impurities are found, more laborious techniques, such as LC-MS, may then be employed to identify the cause of the impurity. To cap it all, the chemical characterization of organic compounds is used in research as well as for quality control (QC).

Preparing samples for CHNS(O) analysis is a time and labor-intensive process.

Microbalances are very sensitive and can take several seconds to settle before

releasing the weight result.

CHNS analyser will be used for analysis.

iii. **Thermogravimetric Analysis**

The Thermogravimetric Analysis (TGA) is a remarkable technique used to characterize materials used in various pharmaceutical, food, environmental, and petrochemical applications. TGA measures the composition, purity, decomposition reactions, decomposition temperature and absorbed moisture content of your products.

- It is beneficial in routine analysis of content determination to get accurate understanding of sample composition.
- It helps in understanding the reactivity corrosivity of sample materials when exposed to specific environments.
- TGA analyzes the changes in size, shape and overall mass when exposed to varying temperatures.
- It gives accurate details of the mass change of the materials under test.
- It provides necessary data for a wide range of materials characterization objectives.
- Determines the stability of pharmaceutical drugs.
- Allows quantitative composition analysis.
- It determines the purity of a mineral, inorganic compound, or organic material.
- Helps in determining the water/carbon content or other residual solvents in a material.
- Allows analysis of reactions with air, oxygen, or other reactive gas.

iv. **Differential Scanning Calorimetry (DSC)**

About 90% of the [pharmaceutical](#) products available are in the solid form (e.g., tablets). To ensure the quality of the products, the concentration and distribution of its components (APIs and Excipients) needs to be determined. The API may be of crystalline or amorphous solid state while the excipient can be solid, liquid, or gas. To make the API soluble and stable, different ways for dispersion are considered. For this, DSC is an excellent tool in characterizing solid dispersions. The correct determination of T_g helps in knowing about the proper storage conditions, therefore, avoiding phase transitions.

Compatibility study of drug with excipient is of great importance in the pharmaceutical industry which is studied by **DSC** along with the help of **X-ray diffraction** and **Infrared spectroscopy**.

v. **Genotoxin Nitrosamine Testing and Analysis**

All pharmaceutical testing laboratories do not have the necessary equipment or the technicians to conduct the specific testing to analyse the levels of NDMA and other nitrosamines as they are mostly present only at ppm levels. Genotoxins at any level are considered unsafe and therefore there is a need to detect their presence as they can cause adverse health effects.

Labs should have the latest instruments and use the correct methods for detection of genotoxic impurities in drug substances and drug products like

LCMS-MS, GCMS-MS, GC-HS. We carry out elemental impurity analysis, using **ICP-MS or ICP-OES.** The labs should also have experienced in carrying out developmental and validation testing using **LCMS-MS, GCMS-MS, ICP-MS, ICP-OES, AAS, HPLC, GCHS.**

vi. Solid State Characterization

Solid State Characterization is a crucial aspect in the development of pharmaceuticals as drug products are mostly produced as solid materials and it is highly significant for the pharmaceutical industry. Even a slight change in structure or particle size of a drug product can affect Pharmacological behavior of a drug.

Some of the most common methods to measure changes in structure include **infrared spectroscopy, X-Ray Diffraction, Differential Scanning Calorimetry, Thermogravimetric Analysis, and Microcalorimetry.**

vii. Raw Materials Testing

Raw material testing is crucially important for ensuring safety, quality, and efficacy of pharmaceutical products.

There are many things to be considered that could impact the way raw materials need to be blended, such as polymorphism, the particle size of raw materials and other properties.

Hence, raw material analysis is essential to determine the purity, identity, and quality of the raw materials before they go into the manufacturing process.

Need to carry out **material analysis, DSC analysis, chemical tests, physical characterisation, [FTIR testing](#) and more,** all according to the specifications and safety protocols established by the **FDA and CDSCO.**

List of some common tests:

- Assay
- Impurities and Related Substances
- Residual Solvents and Organic Volatile Impurities
- Identification tests by FTIR, chemical analysis et cetera
- Limit tests for heavy metals by chemical methods or by ICP or ICP MS
- [Microbial limit tests](#)
- Sterility testing
- Microbiological assays
- Particle size distribution by optical microscopy
- [Particle size distribution by laser diffraction particle size analyser](#)
- Test for crystallinity
- Melting point
- Differential scanning calorimetry (DSC)
- X-ray diffraction (XRD)
- and many more test

Our services will include identity, purity as well as functional testing for various dosage sterile and non-sterile forms like tablets, capsules, syrups, dry syrups, suspensions, suppositories, pessaries, eyedrops, ointments, transdermal patches, small volume parenterals and large volume parenterals et cetera.

Some of the pharmaceutical tests that we will routinely carry out are listed below –

- Description
- Assay
- Identification
- Uniformity of content / uniformity of dosage units
- Disintegration test
- Friability test
- Single and multi-point dissolution testing
- Related substances and impurities
- [Microbiological limit tests](#)
- Pathogens
- Sterility testing
- Pyrogen/Endotoxin testing
- [Preservative efficacy testing](#)
- [Particle counts for large and small volume parenterals](#)
- [Osmolarity measurement](#)
- [Particle size distribution](#)
- Viscosity measurements

Besides carrying out routine analysis and release testing report we will also perform stability studies and analytical method development and validation studies to support SME's for their product development and registration in both semi-regulated and highly regulated markets.

ix. **Stability Testing**

Stability testing is integral to developing new pharmaceutical products and active pharmaceutical ingredients, to establish their shelf life or expiry date. It is also equally important along with ongoing routine manufacturing to monitor product quality as a function of time. We will provide a complete solution to your requirements of **Stability Studies for Shelf-Life Estimation** during

- Product Development
- Product [Shelf life](#) evaluation
- Packing Material development & change over
- For Product Registration in Global Markets
- Critical supplier change
- **Physical Changes:** With the stability test, researchers monitor changes in the physical attributes of the drug when stored for specified durations. Key changes that are monitored include the change in color, water content level, change in pH, change in viscosity, presence of crystalline substances, and its difference in dissolution and disintegration properties from the day it was packed.
- **Chemical Changes:** The stability protocol for pharmaceutical products, when analyzing chemical evidence, is to look for the presence of residual solvents, related substances, and any degradation by-products along with assay.

- **Microbial Changes:** Stability studies prove that pharmaceutical drugs, when stored for long periods at room temperature and in temperature-controlled conditions, can lead to a change in the microbial level. In microbial stability studies of drugs, researchers look for the presence of pathogenic microorganisms and the effectiveness of added microbial preservatives, and any impact on the efficiency of the drug.
- **Real-Time Stability Testing:** This form of stability testing is conducted on drugs for the same duration as the recommended shelf life. In this, regular periodic tests are conducted and conclusive analysis is done for its composition, efficiency, and reaction to various conditions. The trend analysis from this periodic testing is compared with different batches and a linear conclusion is approached.
- **Retained Sample Stability Studies:** This testing procedure is practiced for every marketed product that requires stability studies. In this, the stability of the drug is periodically inspected and is allowed a degradation percentage of 2-5. For example, if a pharmaceutical drug has a shelf life of 5 years, the drug is tested in its 3rd, 6th, 12th, 24th, 36th, 48th and 60th month and the changes in its physical, chemical, and microbial composition are noted and compared with the regulated permissible levels.
- **Cyclic Temperature Stress Testing:** This testing procedure is not compulsory and drugs undergo this test on a case to case basis. In this, the minimum and maximum temperature conditions are mimicked in a controlled environment and the drugs are exposed to these conditions for 24 hours and the changes if any are noted.
- Normally the drug undergoes 20 cycles of cyclic temperature stress testing before any conclusive analysis on its stability is made.
- **Accelerated Stability Testing:** This is a form of shelf-life testing and is used to gain insights on the predicted shelf life of the drug. In this, the drug is exposed to more than ambient temperatures and the changes are noted. Earlier the drug used to be exposed to extreme conditions and the amount of heat required to cause chemical composition failure was noted. This information was used to extrapolate the shelf life and relative stability of the pharmaceutical product.

For statistical linearity, the drug is exposed to 4 different temperature conditions and the exposure to accelerated conditions after refrigeration is also noted. Now the protocols are simplified and based on target markets and storage conditions, single accelerated condition storage usually at 40 degree celsius and 75% Humidity is used as per ICH.

x. **Pharmaceutical Microbiology Testing**

Microbiological testing plays an important role in the production of pharmaceutical drug substances and drug products.

We will provide pharmaceutical microbiology [testing services](#) to manufacturers of both sterile and non-sterile pharmaceutical products and substances. Our laboratories are well equipped and carry out all the required microbiological testing for pharmaceutical industry including –

Sterility Testing:

[Sterility testing](#) is an essential microbiology testing requirement that ensures sterile pharmaceuticals, medical equipment and substances are safe for use. We offer two sterility testing methods:

- Direct Inoculation
- Membrane Filtration

Bacterial Endotoxin Testing by LAL Test:

Limulus Amoebocyte Lysate (LAL) test is performed to check and quantify bacterial endotoxins that are extracted from the products.

Microbial Limit Tests:

Microbial contamination testing is performed for non-sterile products in which harmonised pharmacopoeia or client-supplied methods are used that determine the bioburden within the sample.

Total Bacterial Counts: Total bacterial count indicates the number of microorganisms present in a sample. The number of microorganisms should not be greater than the specified guide values that are expressed in CFU (colony-forming units) per gram or milliliter.

Total Fungal Counts: It indicates fungal count present in a sample. Monitoring this is important to know about the fungal contamination in pharmaceuticals.

Detection of Pathogens:

Detection of pathogens in pharmaceuticals finished products and raw materials is important for the safety and well-being of the consumers.

Antibiotic Assay: This is done to determine the efficiency of antibiotics.

Vitamin Assay: It is important to determine the potency of vitamins.

Assay for Probiotics like Lactobacillus: It is used for the total viable count. It is important to ensure that the product is fit for human consumption.

Preservative Efficacy Testing: This test is performed to check the type and minimum effective concentration of preservative that is required for satisfactory preservation of pharmaceuticals.

Total Viable and Non-Viable Particle Count in Large Volume Parenterals

This is a critical test and is a mandatory pharmacopeial requirement. Either a microscopic particle count or a light obscuration liquid particle counter is used to perform this test

- ii. L-1 is “Non-MSE but Class-I local supplier” - Purchase preference is to be given to MSEs, if eligible, as per PPP-MSE Order. Balance quantity is to be awarded to L-1 bidder.*
- iii. L-1 is “MSE but non-Class-I local supplier” - Purchase preference is to be given to Class-I local suppliers, if eligible, as per PPP-MII Order. Balance quantity is to be awarded to L-1 bidder.*
- iv. L-1 is “Non-MSE non-Class-I local supplier” - Purchase preference is to be given to MSEs as per PPP-MSE Order.
